7. 3-wire serial communications

For 3-wire serial communication timing, it is shown in Fig.6. For register setting, please refer to application note.

8. DC-DC Converter Circuit

A015AN05 contains one high-power step-up DC-DC converter, and a backplane drive circuitry for active matrix TFT LCDs. The output voltage of the main boost converter can be set from VCC to 13.5V with external resistors. Also, there are a precision 0.6V reference voltage, a fault detection and a logic shutdown included in A015AN05.

a .Boost Converter

A015AN05 main boost converter uses a boost PWM architecture to produce a positive regulated voltage. Please refer to Fig. 1 for the DC-DC converter block diagram.

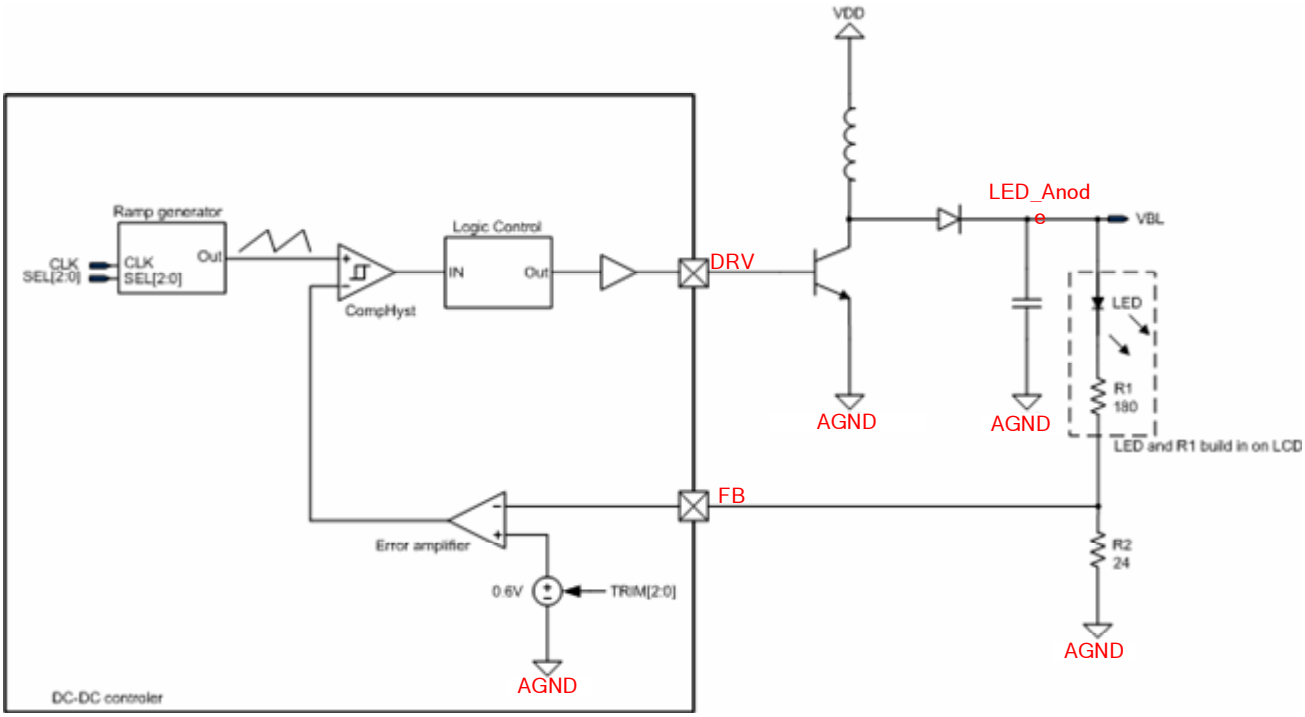

Fig. 1 Dc-Dc converter block diagram

In the internal architecture of DC-DC converter as shown in Fig. 2, the feedback voltage (VFB) will connect to the tri-angle waveform comparator, and generates the output signal (CP0) which determines the duty cycle for (Fdc).

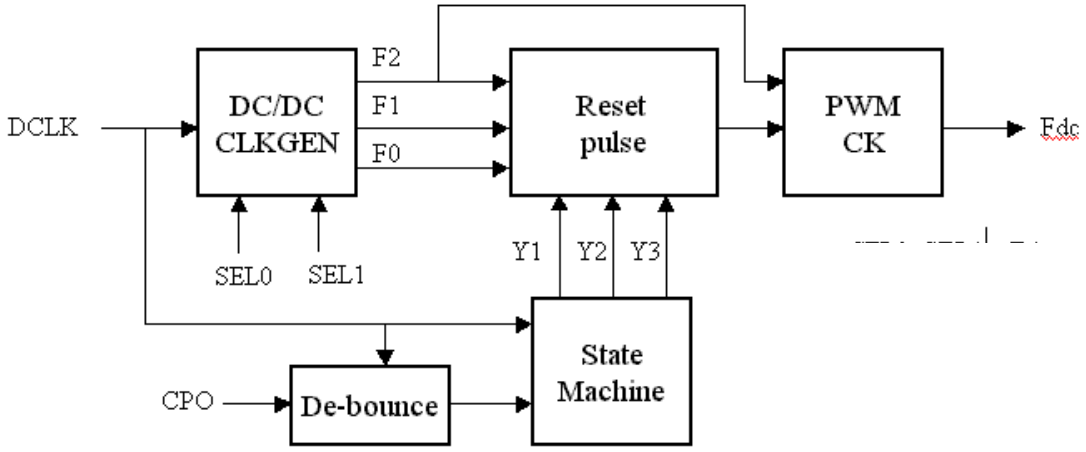

Fig. 2 DC CK block diagram

To reduce the noise affect, CP0 will be processed by De-bounce circuit. State-machine will generate the duty cycle by CP0 signal. To make sure that VFB can reach default VREF quickly, so that State-machine is designed as a discrete step by step function, please refer to Fig. 3. If CP0 is low, the duty cycle will work from 0% to 75%, and the maximum f that is 75%.

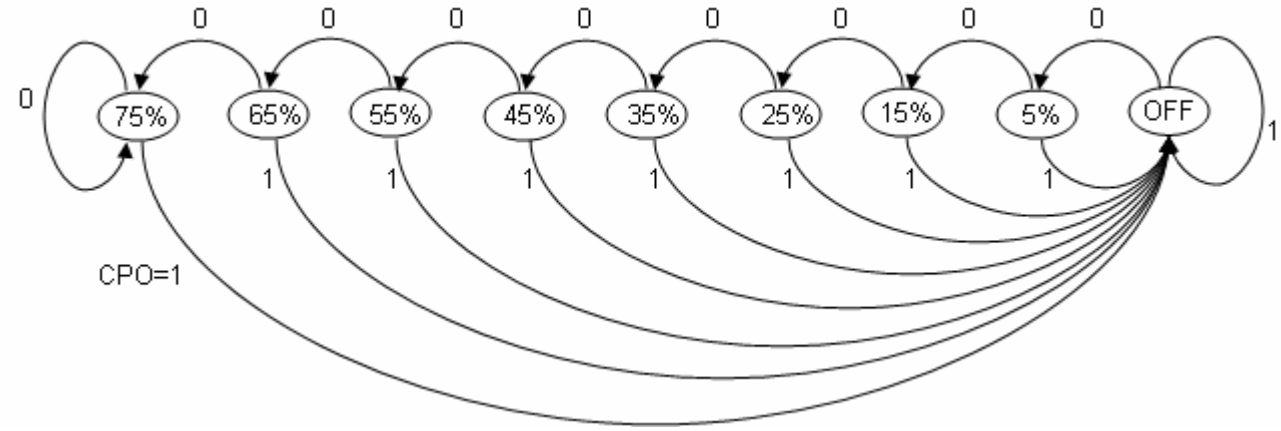

Fig. 3 PWM Control state diagram

b. Charge Pump Block Diagram

The LED_Anode Voltage is used for internal pump circuit to generate VGH/Vgoff_H/ Vgoff_L/Vcac for gate and VCOM used.

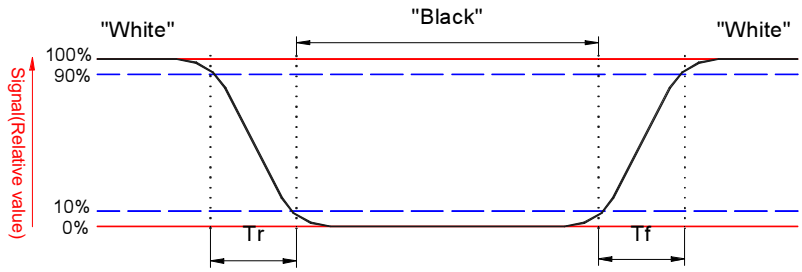
Note 1 Ambient temperature = 25□.

Note 2 Measured in the dark room

Note 3 Measured on the center area of panel with a field angle of 1° by Topcon luminance meter BM-7, after 10 minutes operation.

Note 4 Definition of response time:

Output signals of photo detector are measured when the input signals are changed from “black” to “white” (falling time) and from “white” to “black” (rising time), respectively.



Response time is defined as the time interval between the 10% and 90% of amplitudes. Refer to the figure as follows.

Note 5 Definition of contrast ratio:

Contrast ratio is calculated with the following formula.

$$\text{Contrast ratio (CR)} = \frac{\text{Photo detector output when LCD is at “White” state}}{\text{Photo detector output when LCD is at “Black” state}}$$

Note 6 White Vi = V_{i50} + 1.5V

Black Vi = V_{i50} ± 2.0V

“±” means that the analog input signal swings in phase with COM signal.

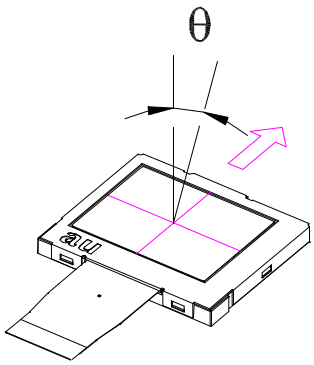
“∓” means that the analog input signal swings out of phase with COM signal.

V_{i50}: The analog input voltage when transmission is 50%

100% transmission is defined as the transmission of LCD panel when all the input terminals of module are electrically opened.

Note 7 Definition of viewing angle:

Refer to the figu



Note 8 Measured at the center area of the panel when all the input terminals of LCD panel are electrically opened.

Note 9 Gray level inversion direction: 6 o'clock

Instruments:NoisekenESS-2000,

Operation System: “CT30AA-A” and adapter “A015AN04 V5T0”

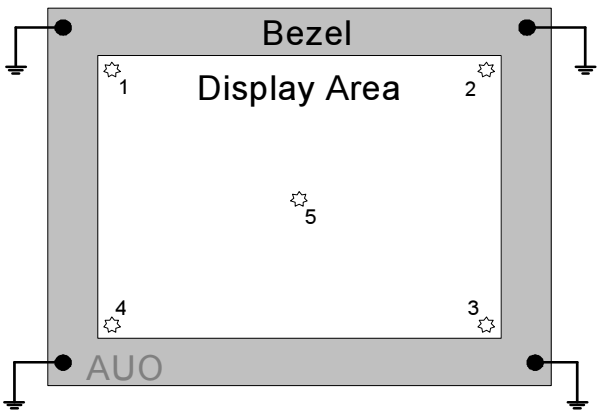
Test Mode: Operating mode, test pattern: colorbar+8Gray scale

Test Method:

Contact Discharge: 150pF(330Ω) 1sec, 5 points, 10 times/point

Air Discharge: 150pF(330Ω) 1sec, 5 points, 10 times/point

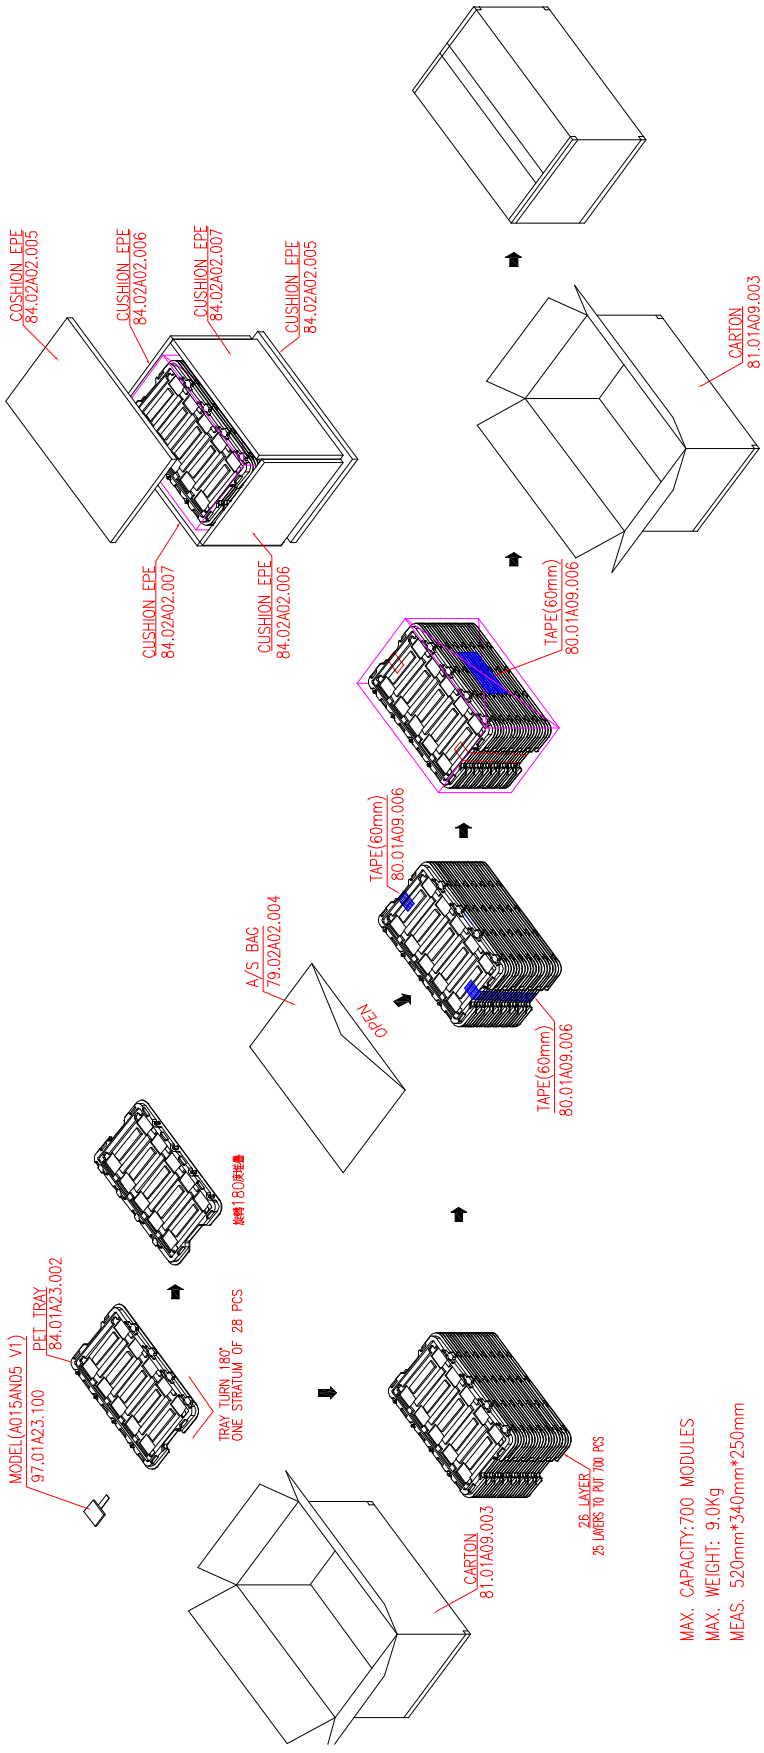
Test point:



The metal casing is connected to power supply ground (0V) at four corners.

All register commands are repeating transfer.

E. Packing Form



Palletizing sequence (if necessary)

(1). Box placement on wooden pallet

a. Place max 30 of corrugated boxes on wooden pallet and should not be pushed out of the pallet. (as showed below)

b. (700 *6) *5 layers: Max 30 boxes / pallet. (21000 pcs modules)

(2). Apply stretch film. Corner angle and PE band

a. Stretch film should cover around whole pallet.

b. Apply corner angle to 4 top edge and 4 side edge of the pallet.

c. Select corner angle length by height of palletizing.

d. PE band number is depended on customer requirement and height of palletizing.

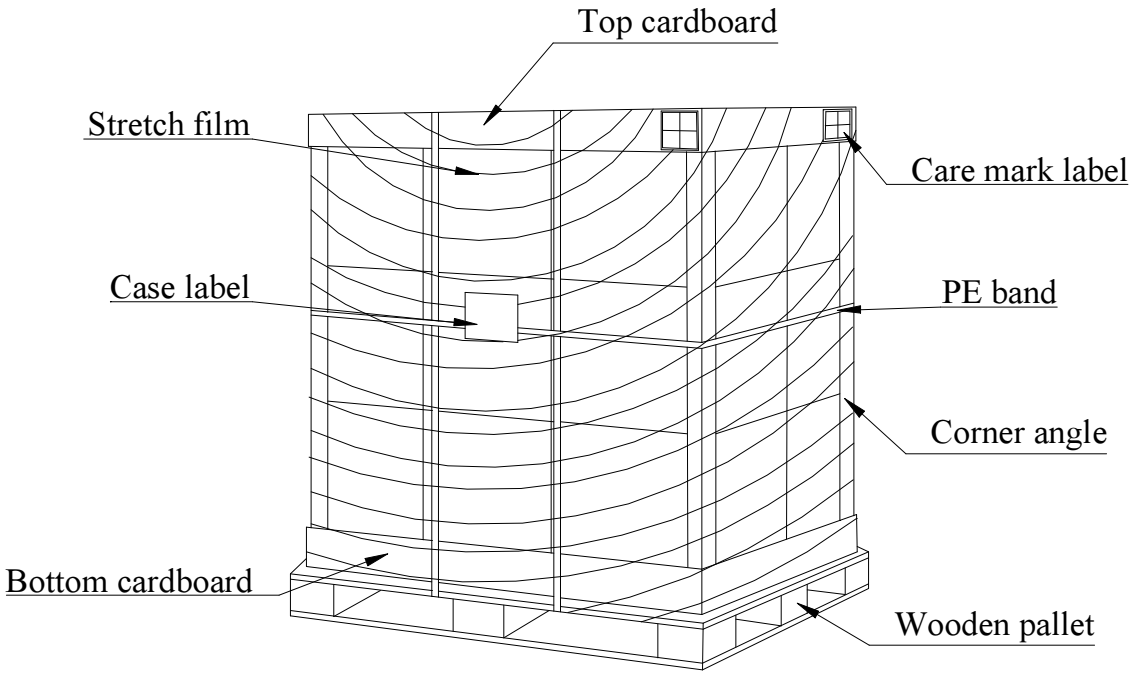
(3). Labeling

a. Apply shipping case label is depended on customer requirement.

b. Apply care mark label at 4 side (Front / Back / Left / Right)on the pallet.

c. Empty box label is applied if needed.

d. Other package method or label are depended on customer requirement.



Note: Limit of box palletizing=Max 5 layers (ship and stock conditions) for air transport and marine transit.

H. Suggested Application Note

A015AN05 is designed with smart integration advance (SIA) concept for DSC application. This panel integrated not only source driver & gate driver, but also built in power generator and embedded serial communication interface for the function setting.

A015AN05 is supported by two kinds of input timing format: UPS051 and UPS052. Customers can use 3-wire serial port for setting register and select different timing for their own design feature.

In this document, we list essential parameters for configuration. Please follow our recommend setting to achieve the best performance. In the last page, we provide application circuit to drive A015AN05.

For A015AN05 driving circuit design, you just need input one set of power 3.3V, because the charge-pump circuit inside the driver IC produces Vgh & Vgl. The external peripheral is very simple and good for saving BOM cost for customers.

Suggested reference application circuit

(1) Internal LED booster circuit

The integrated driver IC provides build-in LED booster controller, DC-DC charge pump, and VCOM driver. See Fig. 8 for the application circuit. The recommended capacitance values of the external capacitor please refer to page 5. The capacitors of 411 will be used shrinkage IC.

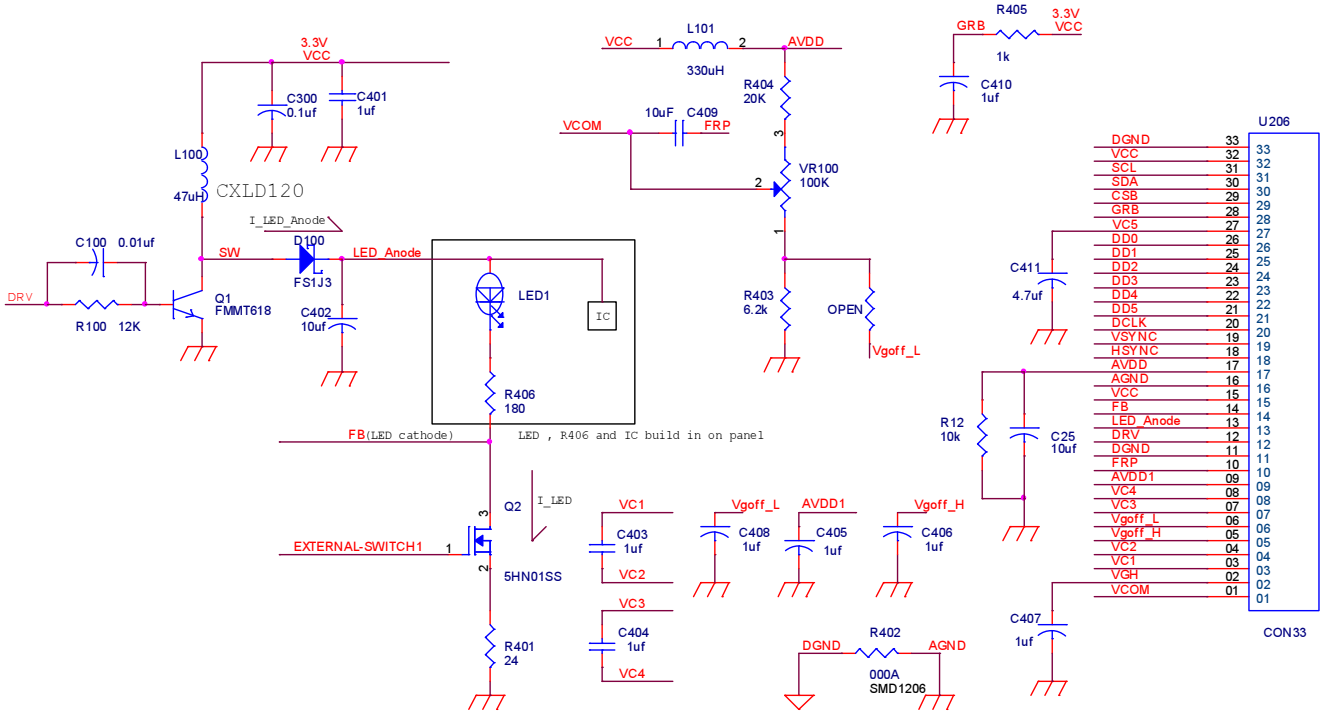

Fig. 8 Typical Application Circuit

Note:

C25 & R12 are new adding external components.

C25 => to stable the AVDD power

R12 => used for discharge AVDD power faster

Q2 ➔ to control backlight on/off function

Note:

Q1 ➔ to control backlight on/off function

EXTERNAL-SWITCH2 “H” ➔ backlight on

EXTERNAL-SWITCH2 “L” ➔ backlight off

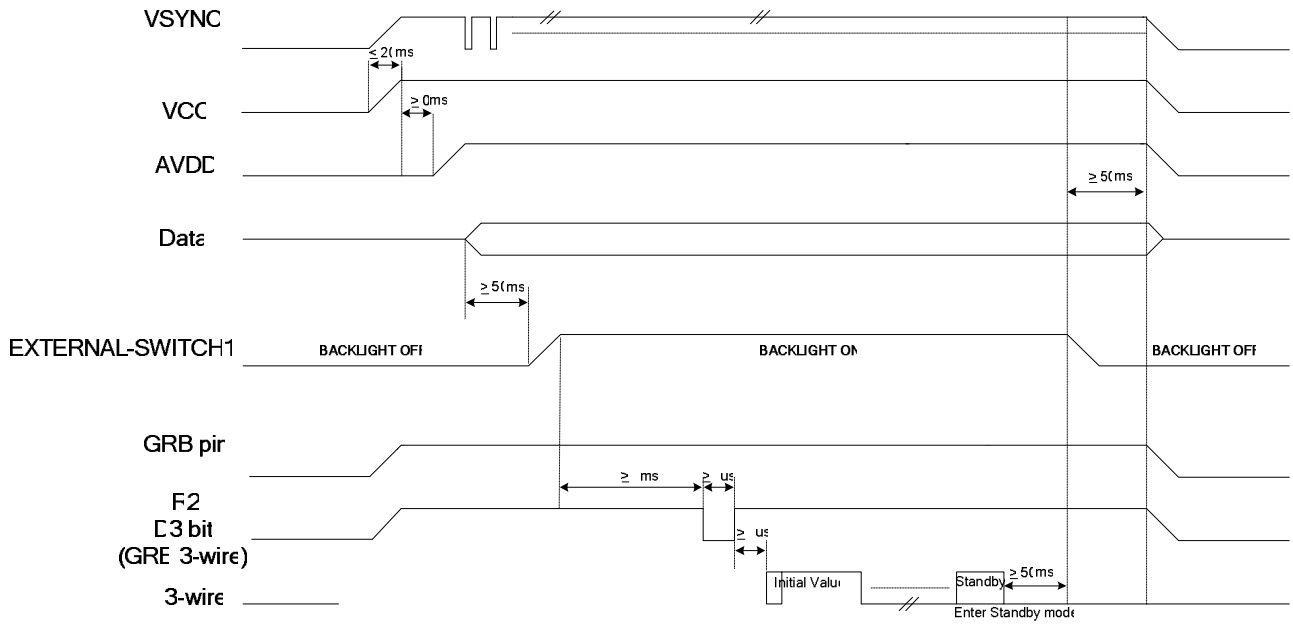
Please refer to suggestion power and standby on/off sequence.

Power supply VCC (typical 3.3V) and AVDD (typical 3.3V) are required to provide driver IC power and generate all necessary voltages for LCD related circuits.

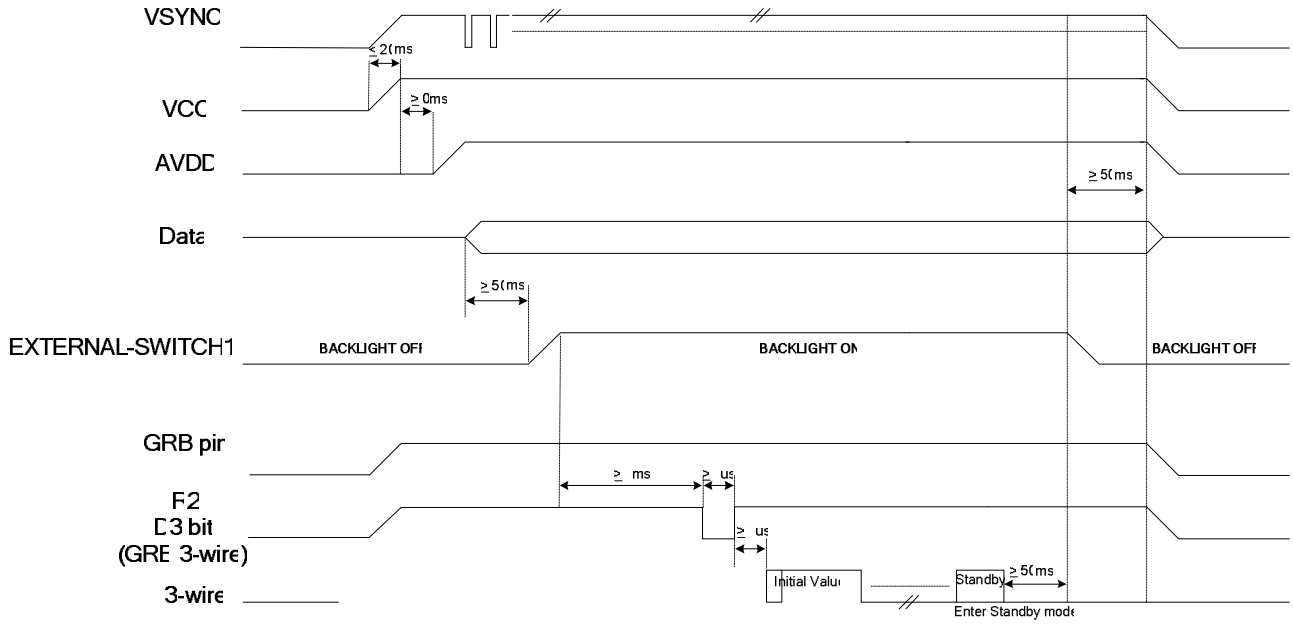
We recommend the external LED driver circuit provide a constant 25mA for LED backlight unit.We suggest the R501 resister value is greater than 30 ohm to turn off DRV signal.The capacitors of C510 will be used shrinkage IC.

Suggestion power on/off sequence

(1) Internal LED booster circuit



(2) External LED circuit

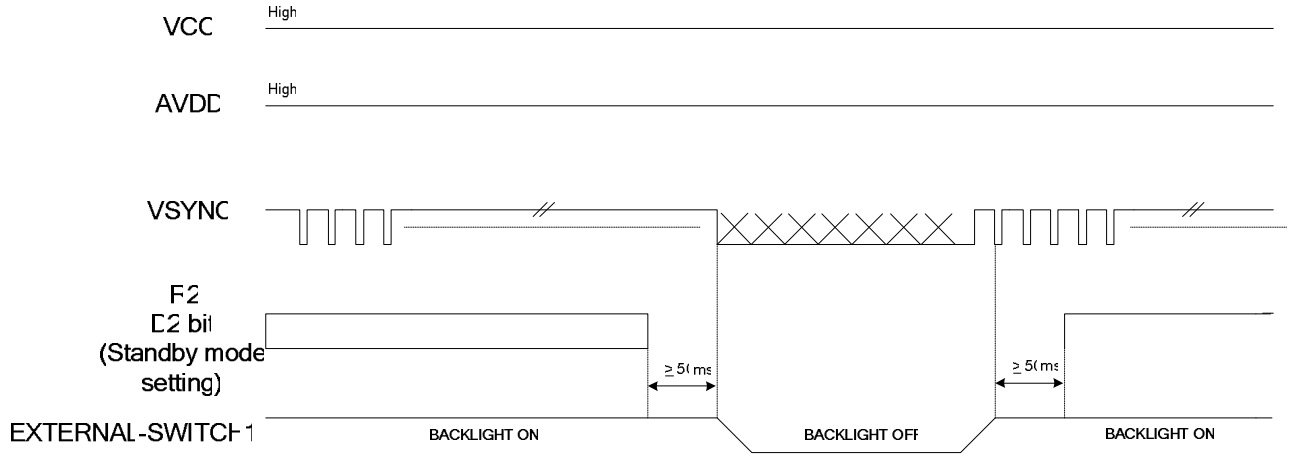


We recommend power on/off sequence that base on differential application circuit to make sure power on/off function can work successfully in every time power on.

Note: In standby mode, VSYNC signal will don't care, but we suggestion VSYNC is disable.

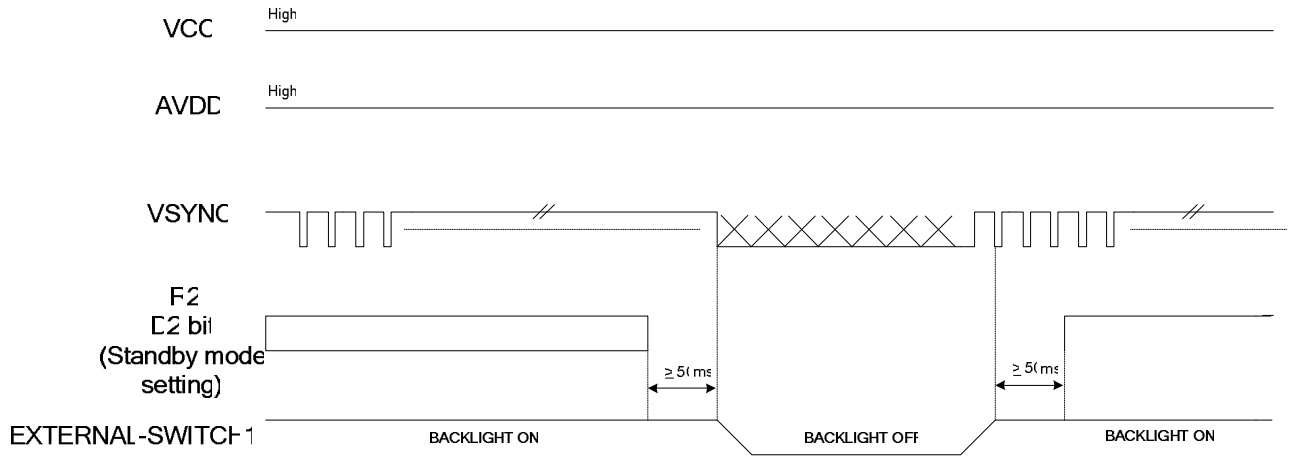
Suggestion Standby on/off sequence

(1) Internal LED booster circuit



Note: xx means don't care this signal.

(2) External LED circuit



Note: xx means don't care this signal.

We recommend standby on/off sequence that base on differential application circuit to make sure function can work successfully.

J. Mechanism Notice for EPSON

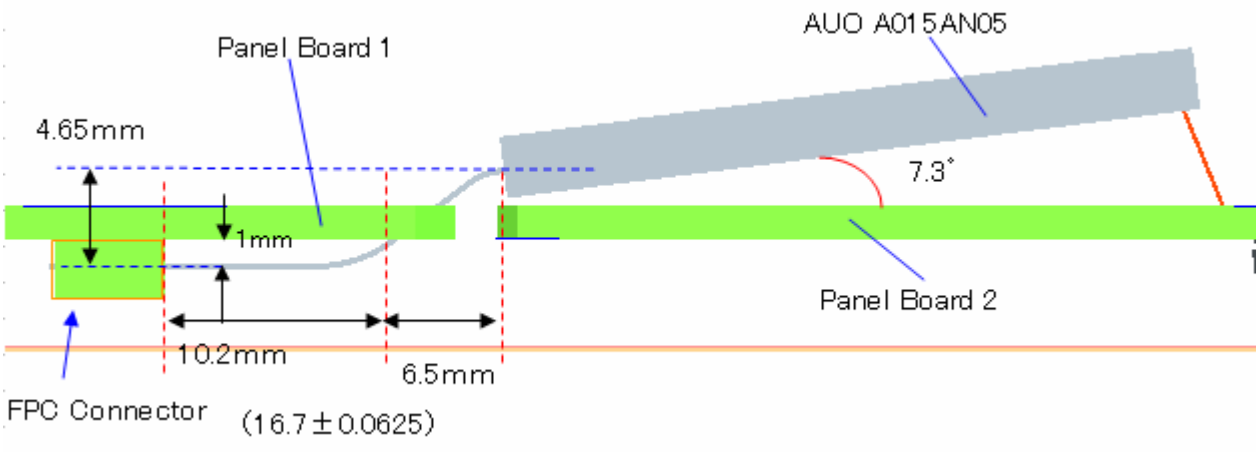

Fig.1

After conducting 30°, 180°, and 270° bending tests around the “non-bending area” of FPC, AUO believes that the panel arrangement in Fig.1 would not lead to FPC damage at the soldering points.
