FF 00 00 XY signals are involved with HSYNC,VSYNC and Field

XY encode following bits:

F=field select

V=indicate vertical blanking

H=1 if EAV else 0 for SAV

P3-P0=protection bits

P3=V⊕H P2=F⊕H P1=F⊕V P0=F⊕V⊕H

⊕represents the exclusive-OR function.

Control is provided through “End of Video” (EAV) and “Start of Video” (SAV) timing references.

Horizontal blanking section consists of repeating pattern 80 10 80 10

White chromaticity shift		X	θ=0°	(0.28)	(0.32)	(0.36)		
		y		(0.31)	(0.35)	(0.39)		

Note 1. Ambient temperature =25℃.

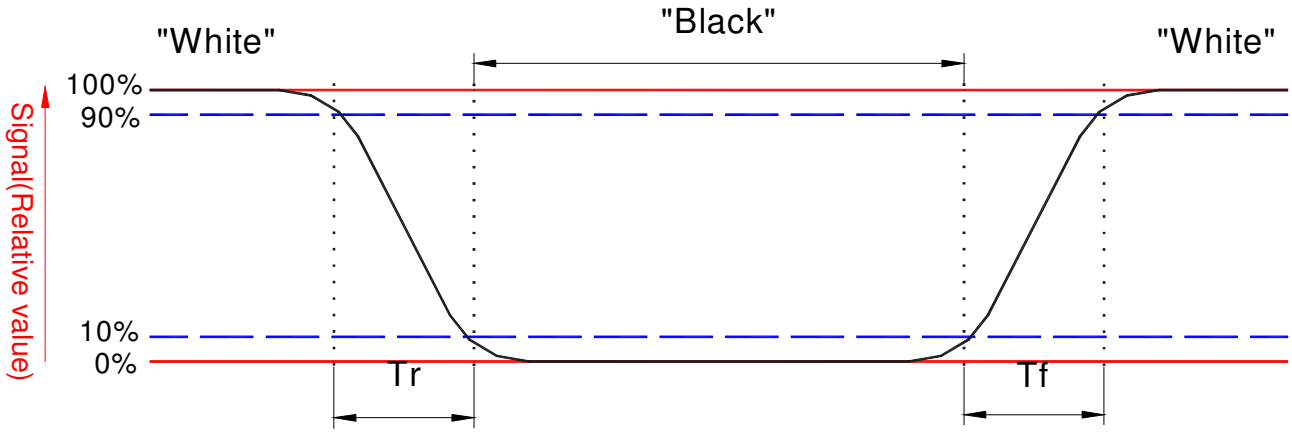
Note 2. To be measured in the dark room.

Note 3.To be measured on the center area of panel with a field angle of 1°by Topcon luminance meter BM-7, after 10 minutes operation under 25 mA.

Note 4. Definition of response time:

The output signals of photo detector are measured when the input signals are changed from “black” to “white”(falling time) and from “white” to “black”(rising time), respectively.

The response time is defined as the time interval between the 10% and 90% of amplitudes. Refer to figure as below.



Note 5. Definition of contrast ratio:

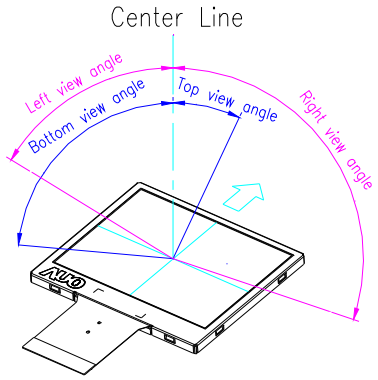
Contrast ratio is calculated with the following formula.

$$\text{Contrast ratio (CR)} = \frac{\text{Photo detector output when LCD is at “White” state}}{\text{Photo detector output when LCD is at “Black” state}}$$

Note 6. White Vi=V_{i5} $\overline{+}$1.5V
Black Vi=V_{i50} ± 2.0V
"±" Means that the analog input signal swings in phase with COM signal.
" $\overline{+}$ " Means that the analog input signal swings out of phase with COM signal.
V_{i50} : The analog input voltage when transmission is 50%
The 100% transmission is defined as the transmission of LCD panel when all the input terminals of module are electrically opened.

Note 7. Definition of viewing angle:

Refer to figure as below.



Note 8. CF Arrangement

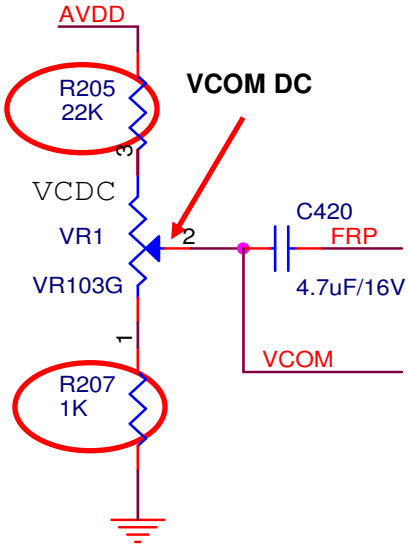
12 The Difference between This model and Previous models (A024CN02 V0 ~ V8, VA)

a. VCOM DC setting

Because the structure of ASIC is different between the new model and original model,

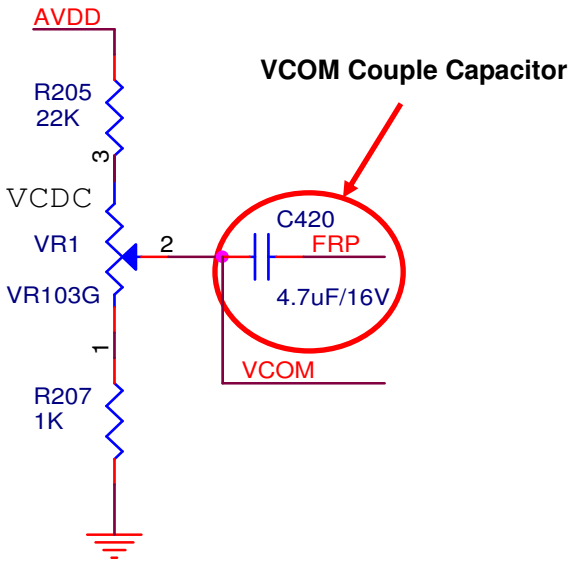
so AUO suggest customer adjust VCOM DC value from 0.45V±0.2 to 0.5V±0.2 to get best display quality.



b. VCOM Couple capacitor

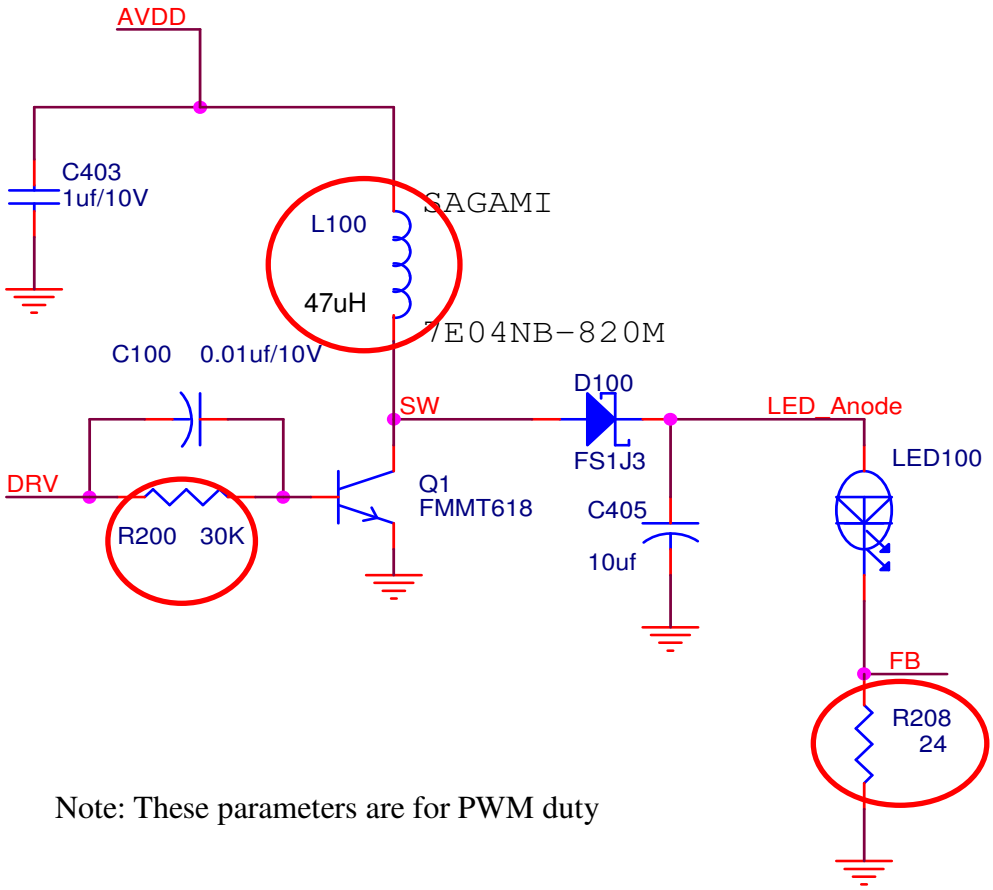
The original panel structure is Cst on gate and the new model is Cst on common.

To avoid Horizontal Cross Talk, AUO suggest modify VCOM couple capacitor (C420) from 1uF to 4.7uF.



c. PWM RC Parameters

AUO suggest to fine-tune PWM RC parameters to get best display performance. If wave like noise phenomenon happened, please fine-tune RWM RC Parameters. By the way, please modify R208 from 30 ohm to 24 ohm to get 25 mA LED current. About the recommend RC Parameters, please refer the following figure.



Note: These parameters are for PWM duty

d. ESD Protection

a. AUO suggests always send serial commend to avoid shutdown phenomenon.

b. AUO suggests connect iron shell to system GND to enhance ESD protection ability.
