ITEM	SYMBOL	MIN.	TYP.	MAX.	UNIT	Note

Lamp Current	I _L	5.5	6	6.5	mA	*1)*2)
Inverter Frequency	F _L	40	-	80	kHz	*1)*3)

Starting Lamp Voltage	Ta=0°C	-	-	1530	V	*1)*5)*6)
	Ta=25°C	-	-	1180		

[Note]

*1) The time that module luminance reduced to 50% of initial value, Base on Ta=25°C, I_L=6mA continuous.

*2) "Life time" is defined as the lamp brightness decrease to 50% original brightness at I_L =6.0mA, continuous lighting, Ta=25°C.

*3) For starting the backlight unit, the output voltage of DC/AC's transformer should be larger than the maximum lamp starting voltage.

*4) If the driving waveform of Lamp is asymmetric, the distribution of mercury inside the lamp tube will become unequally or will deplete the Ar gas in it. Then it may cause the abnormal phenomenon of lighting-up. Therefore, designers have to try their best to for fill the conditions under the inverter designing-stage

as

below :

- The degrees of unbalance : < 10%
- The ratio of wave height : < $\sqrt{2} \pm 10\%$

I_p : high side peak

I_{-p} : low side peak

A : The degrees of unbalance = $| I_p - I_{-p} | / I_{rms} \times 100 (\%)$

B : The ratio of wave height = $I_p \text{ (or } I_{-p}) / I_{rms}$

*5) Frequency in this range can make the characteristics of electric and optics maintain in +/- 10% except

hue. Lamp frequency of inverter may produce interference with horizontal synchronous frequency, and this may cause horizontal beat on the display. Therefore, please adjust lamp frequency, and keep inverter as far from module as possible or use electronic shielding between inverter and module to avoid the interference.

*1) Definition of contrast ratio

Measure contrast ratio on the #5 points (refer to figure1) .

Contrast ratio is calculated with the following formula :

Contrast Ratio (CR)= (White) Luminance of ON \div (Black) Luminance of OFF

*2) Definition of Luminance Uniformity :

Measure maximum luminance(L(MAX))and minimum luminance (L(MIN))on the 9 points as figure 1(#1~#9 poin).Luminance Uniformity is calculated with the following formula :

$$\Delta L = (L(MIN) \div L (MAX)) \times 100$$

*3) Definition of Viewing Angle(θ, ψ),refer to Fig.2 as below

Fig.2 Definition of Viewing Angle

*4) Definition of Response Time.

The response time is defined as the time interval between the 10% and 90% amplitudes.Refer to figure 3 as below.
