Product Specification

1. Summary

This module utilizes amorphous silicon thin film transistors and a 15:9 aspect ratio. The 7.0" active matrix liquid crystal display allows 16,777,216 colors to be displayed by LVDS interface is available.

The applications are CID(Center Information Display), RSE(Rear Seat Entertainment) and Instrument Cluster for a vehicle.

2. Features

- Utilizes a panel with a 15:9 aspect ratio.
- The 7.0" screen produces a high resolution image that is composed of 384,000 pixel elements in a stripe arrangement.
- By adopting In Plane Switching (IPS) technology, provide a wide viewing angle.
- By adopting an active matrix drive, a picture with high contrast is realized.
- By using of COG mounting technology, the module became thin, light and compact.
- By adopting a high aperture panel, high transmittance color filter and high transmission polarizing plates, transmittance ratio is realized.
- Gray scale or the brightness of the sub-pixel color is determined with a 8-bit gray scale signal.

Product Specification**3. General Description**

Active Screen Size	7.0 inches(177.7mm) diagonal
Outline Dimension	166.6mm (H) × 105.8mm (V) X 6.5mm (D) (Typ.)
Pixel Pitch	0.1905mm x 0.1905mm (1Dot: 0.0635mm x 0.1905mm)
Pixel Format	800 horiz. by 480 vert. Pixels, RGB stripe arrangement
Color Depth	8bit(D), 16,777,216 colors
Luminance, White	700 cd/m ² (Center 1point ,Typ.)
Viewing Angle (CR>10)	Viewing angle free (R/L 178 (Min.), U/D 178 (Min.))
Weight	165g (Typ.), 170g (Max.)
Display Mode	Transmissive mode, Normally Black
Surface Treatment	Hard coating(3H), Anti-glare treatment of the front polarizer (Haze 25%)
Backlight Type	LED

Operating Temperature	T_{OP}	-30	85	°C	2,3,4

Note 1. Applies to each LED individually.

2. Temperature and relative humidity range are shown in the figure below.

Wet bulb temperature should be Max. 62°C. Condensation of dew must be avoided, because it may cause electrical current leakage, and deterioration of performance and quality.

3. The operating temperature means that LCD Module guarantees operation of the circuit.

All the contents of Electro-optical specifications are guaranteed under the room temperature condition.

4. This temperature is ambient temperature with regard to the heat which is generated under operation of circuit and backlight on. (reference value)

Note 1. This values applies to one chain (7-LEDs connected in each chain)

2. The allowable forward current of LED vary with environmental temperature.

3. The LED Voltage values are defined from Anode to Cathode at Typ. LED Current.

4. LED Power

- Typ. LED Power = Typ. LED Current x +25℃ Typ. LED Voltage x LED Chain number
- Max. LED Power = Max. LED Current x -30℃ Max. LED Voltage x LED Chain number

5. LED Chain

6. The life time is determined as the time at which brightness of LED is 50% compare to that of initial value at the typical LED current.

7. DC current dimming is recommended for LED control. If PWM dimming is needed, PWM frequency should be optimized for minimal wavy and audible noise.

Low (2 Frame Inversion Mode) ※ Recommend when input signal is Interlace signal.	Invert each 2 frames 

7. Please see the Appendix I for more information about VGH Modulation Method.

8. Please see the Appendix II for more information about Reset Timing.

9. MUTE pin should be controlled as 5-6. Power Sequence to avoid Power on-off display flickering.

10. VSYNC_FB pin is the vertical sync output signal of LVDS input signal.

If customer don't use VSYNC_FB signal, Customer should not connect this pin.(Floating)

11. TEST1~3 pins are used for LCD manufacturing. Customer should not connect these pins.(Floating)

12. The 4.7kΩ resistor is recommended for pull-up or pull-down.

Note 1. Please avoid floating state of all input signals.

2. When the interface signal is invalid, be sure to pull down the power supply for LCD to 0V.

3. When Power On Sequence or during operation, interface signal is not allowed momentary off or abnormal waveform.

4. Backlight must be turn on after power supply for LCD and interface signal are valid.

5. If it is difficult to perform as our recommendation, customers are asked to confirm the Power sequence with LG Display prior to their use.

6. Electro-optical Characteristics

Electro-optical characteristics are determined after the unit has been 'ON' and stable in a dark environment at $25 \pm 2^\circ\text{C}$. The values are specified at an approximate distance 50cm from the LCD surface at a viewing angle of and equal to 0° . Measured value at the center point of LCD panel after more than 15 minutes while backlight turning on.

It is presented additional information concerning the measurement equipment and method in FIG. 1.

FIG. 1 Electro-optical Characteristic Measurement Equipment and Method

$T_a = 25 \pm 2^\circ\text{C}$, $DVDD = 3.3\text{V}$, $AVDD = 13.0\text{V}$, $f_v = 60\text{Hz}$,
 $f_{clk} = 33.26\text{MHz}$, $I_{LED} = 50\text{mA}$

Product Specification

Note 1. Contrast Ratio(CR) is defined mathematically as :

$$\text{Contrast Ratio} = \frac{\text{Surface Luminance with all white pixels}}{\text{Surface Luminance with all black pixels}}$$

It is measured at center 1-point.

2. Surface luminance are determined after the unit has been 'ON' and More than 15 Minute after lighting the backlight in a dark environment at $25 \pm 2^\circ\text{C}$. Surface luminance is the luminance value at center 1-point across the LCD surface 50cm from the surface with all pixels displaying white. For more information see the FIG. 2.

3. The luminance variation(δ_{WHITE}) is determined by measuring LN at each test position 1 through 9. The luminance variation(δ_{WHITE}) is defined as follows ;

$$\text{Luminance Variation } (\delta_{\text{WHITE}}) = \frac{\text{Minimum}(L1, L2, \dots, L8, L9)}{\text{Maximum}(L1, L2, \dots, L8, L9)} \times 100 (\%)$$

For more information see the FIG. 2.

Note 4. Response time is obtained by measuring the transition time of photo detector output, when input signals are applied to make center point "black" and "white". For more information, see the FIG. 3

FIG. 3 Response Time

5. Viewing angle is the angle at which the contrast ratio is greater than 10. The angles are determined for the horizontal or x axis and the vertical or y axis with respect to the z axis which is normal to the LCD module surface. For more information, see the FIG. 4.

Note. Result Evaluation Criteria:

1. There should be no particular problems that may affect the display function at room temperature after 2 hours from the reliability tests finish.
2. TFT-LCD panels should take place at room temperature for 24 hours after the reliability tests finish. Then, all of optical and electrical test should be performed.
3. Display performance quality is monitored before, in the middle of, and after the test, and will be verified after turning into room temperature. (No abnormal display found)

11. PRECAUTIONS

Please pay attention to the following when you use this TFT LCD module.

11-1. MOUNTING PRECAUTIONS

- (1) You must mount a module using specified mounting structure.(Details refer to the drawings)
- (2) You should consider the mounting structure so that uneven force(ex. Twisted stress) is not applied to the module.
And the case on which a module is mounted should have sufficient strength so that external force are not transmitted directly to the module.
- (3) Please attach a transparent protective plate to the surface in order to protect the polarizer.
Transparent protective plate should have sufficient strength in order to resist external force.
- (4) You should adopt radiation structure to satisfy the temperature specification.
- (5) Acetic acid type and chlorine type materials for the cover case are not desirable because the former generates corrosive gas of attacking the polarizer at high temperature and the latter causes circuit break by electro-chemical reaction.
- (6) Do not touch, push or rub the exposed polarizers with glass, tweezers or anything harder than HB pencil lead. And please do not rub with dust clothes with chemical treatment.
Do not touch the surface of polarizer for bare hand or greasy cloth.(Some cosmetics deteriorate the polarizer.)
- (7) When the surface becomes dusty, please wipe gently with absorbent cotton or other soft materials like chamois soaks with petroleum benzine. Normal-hexane is recommended for cleaning the adhesives used to attach front / rear polarizers. Do not use acetone, toluene and alcohol because they cause chemical damage to the polarizer.
- (8) Wipe off saliva or water drops as soon as possible. Their long time contact with polarizer causes deformations and color fading.
- (9) Do not open the case because inside circuits do not have sufficient strength.
- (10) The metal case of a module should be contacted to electrical ground of your system.

11-2. OPERATING PRECAUTIONS

- (1) The spike noise causes the mis-operation of circuits. It should be lower than following voltage :
 $V = \pm 200\text{mV}$ (Over and under shoot voltage)
- (2) Response time depends on the temperature.(In lower temperature, it becomes longer.)
- (3) Brightness depends on the temperature. (In higher temperature, it becomes lower.)
- (4) Be careful for condensation at sudden temperature change. Condensation makes damage to polarizer or electrical contacted parts. And after fading condensation, smear or spot will occur.
- (5) When fixed patterns are displayed for a long time, remnant image is likely to occur.
- (6) Module has high frequency circuits. Sufficient suppression to the electromagnetic interference shall be done by system manufacturers. Grounding and shielding methods may be important to minimize the interference.

Product Specification**11-3. ELECTROSTATIC DISCHARGE CONTROL**

Since a module is composed of electronic circuits, it is not strong to electrostatic discharge. Make certain that handling persons are connected to ground through wrist band etc. And don't touch interface pin directly.

11-4. PRECAUTIONS FOR STRONG LIGHT EXPOSURE

Strong light exposure causes degradation of polarizer and color filter.

11-5. STORAGE

When storing modules as spares for a long time, the following precautions are necessary.

- (1) Store them in a dark place. Do not expose the module to sunlight or fluorescent light. Keep the temperature between 5°C and 35°C at normal humidity.
- (2) The polarizer surface should not come in contact with any other object.
It is recommended that they be stored in the container in which they were shipped.

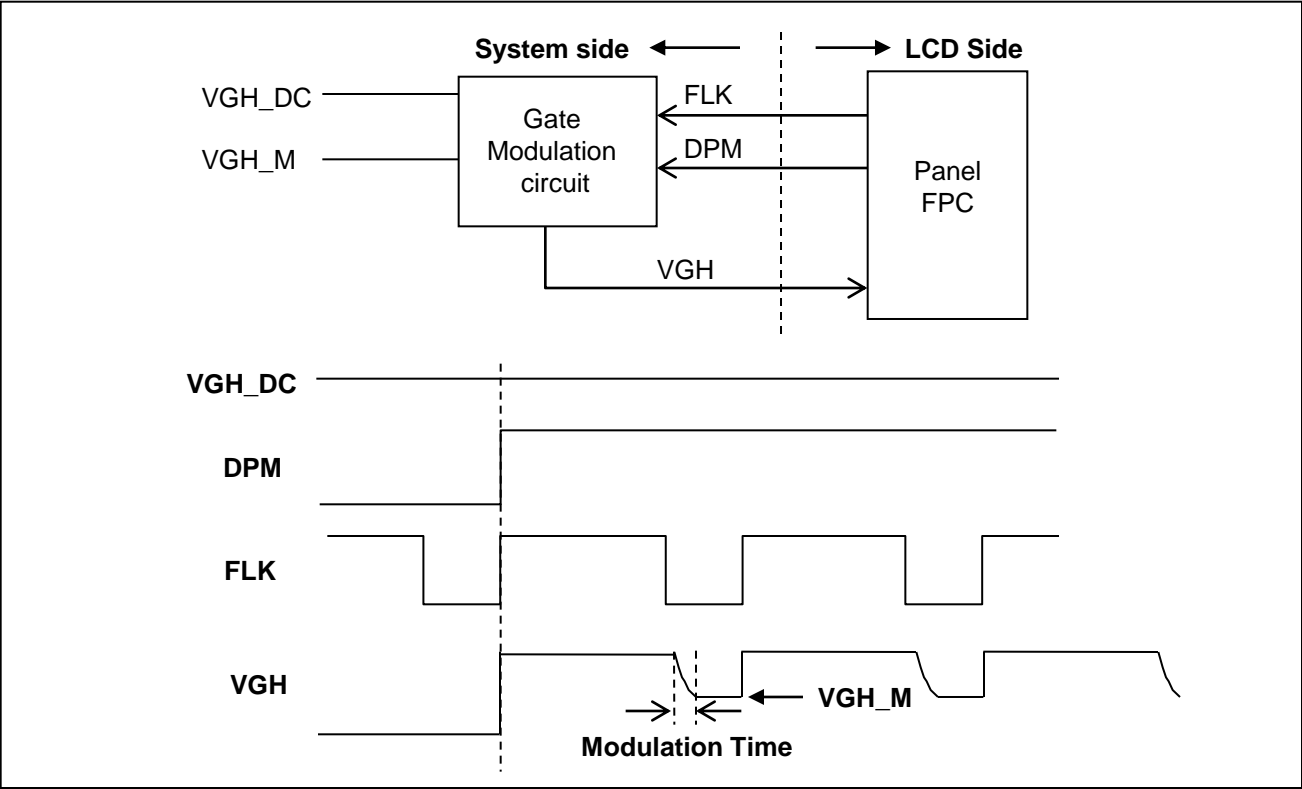

11-6. HANDLING PRECAUTIONS FOR PROTECTION FILM

- (1) The protection film is attached to the bezel with a small masking tape or a double side tape.
When the protection film is peeled off, static electricity is generated between the film and polarizer.
This should be peeled off slowly and carefully by people who are electrically grounded and with well ion-blown equipment or in such a condition, etc.
- (2) When the module with protection film attached is stored for a long time, sometimes there remains a very small amount of glue still on the bezel after the protection film is peeled off.
- (3) You can remove the glue easily. When the glue remains on the bezel surface or its vestige is recognized, please wipe them off with absorbent cotton waste or other soft material like chamois soaked with normal-hexane.

APPENDIX- III

■ Thermistor Characteristics

Note 1. Thermistor type is NCP15XH103F03RC.

The display module shall incorporate a NTC thermistor surface mounted to the LED array.

The user of LCD module can utilize this thermistor for some special purpose.

For example, the user can measure display temperature from the thermistor and then turn off backlight when LCD module temperature exceeds maximum rating.

2. $R_{\text{thermistor}}$ in the table is the feature of the thermistor by itself, and R_{THER} is measured value in the LCM. Customers should refer to the value of R_{THER} for LED derating.

3. $R_{\text{thermistor}}$ is typical value.
