I<sub>IS</sub>: the maximum current of the first 100ms after power-on

Measurement Conditions: Shown as the following figure. Test pattern: black.

**VCCS rising time is 0.5ms**

# PRODUCT SPECIFICATION

Note (3) The specified power supply current is under the conditions at  $V_{CCS} = 3.3\text{ V}$ ,  $T_a = 25 \pm 2\text{ }^{\circ}\text{C}$ , DC Current and  $f_v = 60\text{ Hz}$ , whereas a power dissipation check pattern below is displayed.

## a. Mosaic Pattern

$V_D$

Note (4) The specified signals have equivalent impedances pull down to ground in the LCD module respectively. Customers should keep the input signal level requirement with the load of LCD module. Please refer to Note (4) of 4.3.2 LED CONVERTER SPECIFICATION to obtain more information.

Note (5) When a source detects a low-going HPD pulse, it must be regarded as a HPD event. Thus, the source must read the link / sink status field or receiver capability field of the DPCD and take corrective action.

Note (1) I<sub>LED\_RUSH</sub>: the maximum current when LED\_VCCS is rising,

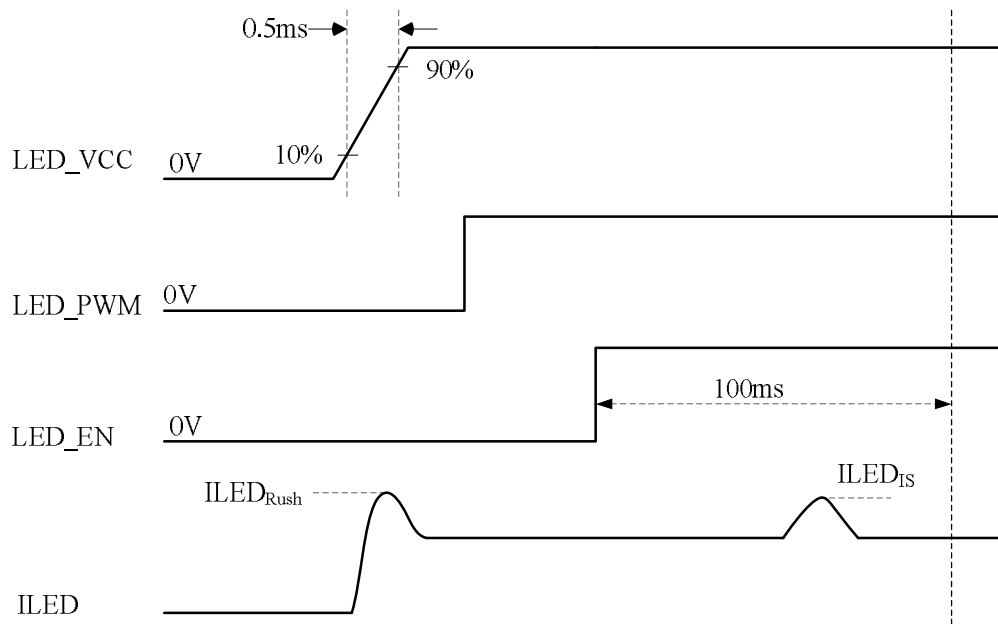

I<sub>LED\_IS</sub>: the maximum current of the first 100ms after power-on,

Measurement Conditions: Shown as the following figure. LED\_VCCS = Typ, Ta = 25 ± 2 °C, f<sub>PWM</sub> = 200 Hz, Duty=100%.

# PRODUCT SPECIFICATION

**VLED rising time is 0.5ms**

Note (2) If PWM control frequency is applied in the range less than 1KHz, the “waterfall” phenomenon on the screen may be found. To avoid the issue, it's a suggestion that PWM control frequency should follow the criterion as below.

PWM control frequency  $f_{PWM}$  should be in the range

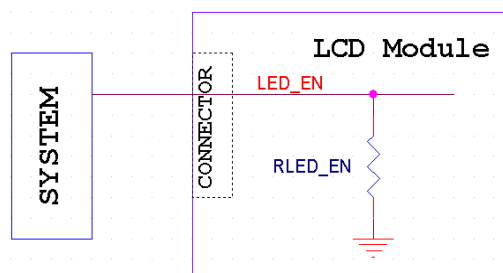

$$(N + 0.33) * f \leq f_{PWM} \leq (N + 0.66) * f$$

$N$  : Integer ( $N \geq 3$ )

$f$  : Frame rate

Note (3) The specified LED power supply current is under the conditions at “LED\_VCCS = Typ.”,  $T_a = 25 \pm 2^\circ\text{C}$ ,  $f_{PWM} = 200\text{ Hz}$ , Duty=100%.

Note (4) The specified signals have equivalent impedances pull down to ground in the LCD module respectively. Customers should keep the input signal level requirement with the load of LCD module. For example, the figure below describes the equivalent pull down impedance of LED\_EN (If it exists). The rest pull down impedances of other signals (eg. HPD, PWM ...) are in the same concept.

Note (5) If the cycle-to-cycle difference of PWM duty exceeds 0.1%, especially when the PWM duty is low, slight brightness change might be observed.

### 4.3.3 BACKLIGHT UNIT

$T_a = 25 \pm 2 \text{ }^{\circ}\text{C}$

Parameter	Symbol	Value			Unit	Note
		Min.	Typ.	Max.		
LED Light Bar Power Supply Voltage	$V_L$	26	29	30	V	(1)(2)(Duty100%)
LED Light Bar Power Supply Current	$I_L$	--	90	--	mA	
Power Consumption	$P_L$	2.34	2.61	2.7	W	(3)
LED Life Time	$L_{BL}$	15000	-	-	Hrs	(4)

Note (1) LED current is measured by utilizing a high frequency current meter as shown below :

Note (2) For better LED light bar driving quality, it is recommended to utilize the adaptive boost converter with current balancing function to drive LED light-bar.

Note (3)  $P_L = I_L \times V_L$  (Without LED converter transfer efficiency)

Note (4) The lifetime of LED is defined as the time when it continues to operate under the conditions at  $T_a = 25 \pm 2 \text{ }^{\circ}\text{C}$  and  $I_L = 22.5 \text{ mA}$  (Per EA) until the brightness becomes  $\leq 50\%$  of its original value.

- Upon LCDVCC power-on (within T2 max)
- When the "NoVideoStream\_Flag" (VB-ID Bit 3) is received from the Source (at the end of T9)

Note (3) The Sink may implement the ability to disable the automatic Black Video function, as described in Note (2), above, for system development and debugging purposes.

Note (4) The Sink must support AUX Channel polling by the Source immediately following LCDVCC power-on without causing damage to the Sink device (the Source can re-try if the Sink is not ready). The Sink must be able to response to an AUX Channel transaction with the time specified within T3 max.

# PRODUCT SPECIFICATION

Note (1) Definition of Viewing Angle ( $\theta_x$ ,  $\theta_y$ ):

Note (2) Definition of Contrast Ratio (CR):

The contrast ratio can be calculated by the following expression.

$$\text{Contrast Ratio (CR)} = L_{63} / L_0$$

L63: Luminance of gray level 63

L 0: Luminance of gray level 0

$$CR = CR(1)$$

CR (X) is corresponding to the Contrast Ratio of the point X at Figure in Note (6).

Note (3) Definition of Response Time ( $T_R$ ,  $T_F$ ):

Note (4) Definition of Average Luminance of White ( $L_{AVE}$ ):

Measure the luminance of gray level 63 at 5 points

$$L_{AVE} = [L(1) + L(2) + L(3) + L(4) + L(5)] / 5$$

L (x) is corresponding to the luminance of the point X at Figure in Note (6)

## PRODUCT SPECIFICATION

Note (5) Measurement Setup:

The LCD module should be stabilized at given temperature for 20 minutes to avoid abrupt temperature change during measuring. In order to stabilize the luminance, the measurement should be executed after lighting Backlight for 20 minutes in a windless room.

Note (6) Definition of White Variation ( $\delta W$ ):

Measure the luminance of gray level 63 at 5 points

$$\delta W_{5p} = \{\text{Minimum [L (1)~ L (5)] / Maximum [L (1)~ L (5)]}\} * 100\%$$

$$\delta W_{13p} = \{\text{Minimum [L (1)~ L (13)] / Maximum [L (1)~ L (13)]}\} * 100\%$$

## PRODUCT SPECIFICATION

Note (7) The listed optical specifications refer to the initial value of manufacture, but the condition of the specifications after long-term operation will not be warranted.

Note (8) Definition of color gamut (C.G%):

$$C.G\% = \frac{R G B}{R_0 G_0 B_0} \cdot 100\%$$

$R_0, G_0, B_0$ : color coordinates of red, green, and blue defined by NTSC, respectively.

$R, G, B$ : color coordinates of module on 63 gray levels of red, green, and blue, respectively.

$R_0 G_0 B_0$ : area of triangle defined by  $R_0, G_0, B_0$

$R G B$ : area of triangle defined by  $R, G, B$

## 8. PRECAUTIONS

### 8.1 HANDLING PRECAUTIONS

- (1) The module should be assembled into the system firmly by using every mounting hole. Be careful not to twist or bend the module.
- (2) While assembling or installing modules, it can only be in the clean area. The dust and oil may cause electrical short or damage the polarizer.
- (3) Use fingerstalls or soft gloves in order to keep display clean during the incoming inspection and assembly process.
- (4) Do not press or scratch the surface harder than a HB pencil lead on the panel because the polarizer is very soft and easily scratched.
- (5) If the surface of the polarizer is dirty, please clean it by some absorbent cotton or soft cloth. Do not use Ketone type materials (ex. Acetone), Ethyl alcohol, Toluene, Ethyl acid or Methyl chloride. It might permanently damage the polarizer due to chemical reaction.
- (6) Wipe off water droplets or oil immediately. Staining and discoloration may occur if they left on panel for a long time.
- (7) If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contacting with hands, legs or clothes, it must be washed away thoroughly with soap.
- (8) Protect the module from static electricity, it may cause damage to the C-MOS Gate Array IC.
- (9) Do not disassemble the module.
- (10) Do not pull or fold the LED wire.
- (11) Pins of I/F connector should not be touched directly with bare hands.
- (12) Do not re-attach protective film onto the polarizer because of risk of bubble mura and dust.

### 8.2 STORAGE PRECAUTIONS

- (1) High temperature or humidity may reduce the performance of module. Please store LCD module within the specified storage conditions.
- (2) It is dangerous that moisture come into or contacted the LCD module, because the moisture may damage LCD module when it is operating.
- (3) It may reduce the display quality if the ambient temperature is lower than 10 °C. For example, the response time will become slowly, and the starting voltage of LED will be higher than the room temperature.

### 8.3 OPERATION PRECAUTIONS

- (1) Do not pull the I/F connector in or out while the module is operating.
- (2) Always follow the correct power on/off sequence when LCD module is connecting and operating. This can prevent the CMOS LSI chips from damage during latch-up.
- (3) The startup voltage of Backlight is approximately 1000 Volts. It may cause electrical shock while assembling with converter. Do not disassemble the module or insert anything into the Backlight unit.

## Appendix. SYSTEM COVER DESIGN GUIDANCE

0.	<b>Permanent deformation of system cover after reliability test</b>
	
Definition	<p>System cover including front and rear cover may deform during reliability test. Permanent deformation of system front and rear cover after reliability test should not interfere with panel. Because it may cause issues such as pooling, abnormal display, white spot, and also cell crack.</p> <p>Note: If the interference can not be avoided, please feel free to contact INX FAE Engineer for collaboration design. We can help to verify and pass risk assessment for customer reference.</p>
1	<b>Design gap C between system front-cover &amp; panel surface.</b>
	
Definition	<p>Gap between system front-cover &amp; panel surface is needed to prevent pooling or glass broken. Zero gap or interference such as burr and warpage from mold frame may cause pooling issue near system front-cover opening edge. This phenomenon is obvious during swing test, hinge test, knock test, or during pooling inspection procedure.</p> <p>To remain sufficient gap, design with system rib higher than maximum panel thickness is recommended.</p> <p>Note: If the interference can not be avoided, please feel free to contact INX FAE Engineer for collaboration design. We can help to verify and pass risk assessment for customer reference.</p>

We can help to verify and pass risk assessment for customer reference.</p>
<b>4</b>	<b>Interference examination of antenna cable and Web Cam wire</b>

## PRODUCT SPECIFICATION

- To prevent panel damage, we suggest using CCD FPC to replace CCD cable
- Using double tape to fix LCM module for no bracket design.

If the antenna cable or Web Cam wire must overlap with the panel outline, both sides of the antenna cable or Web Cam wire must have a sponge(Sponge material can not contain NH3) and sponge require higher antenna cable or Web Cam wire.( Antenna cable or Web Cam wire should not overlap with TCON,COF/FPC,Driver IC)  
Note: If the interference can not be avoided, please feel free to contact INX FAE Engineer for collaboration design. We can help to verify and pass risk assessment for customer reference.

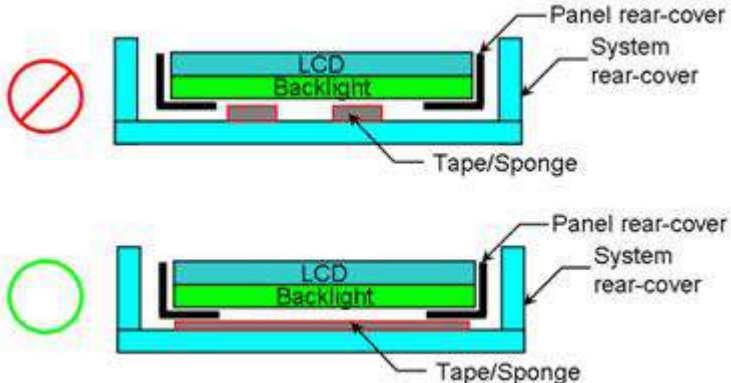

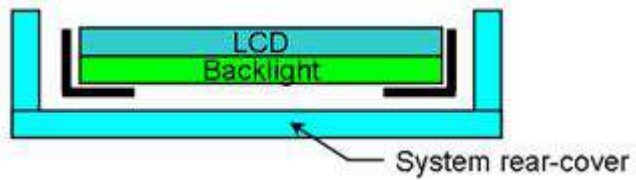

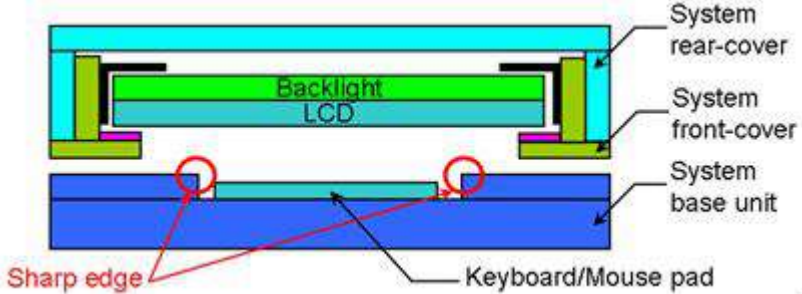

### 5 System rear-cover inner surface examination

**Definition** Burr at logo edge, steps, protrusions or PCB board may cause stress concentration. White spot or glass broken issue may occur during reliability test.

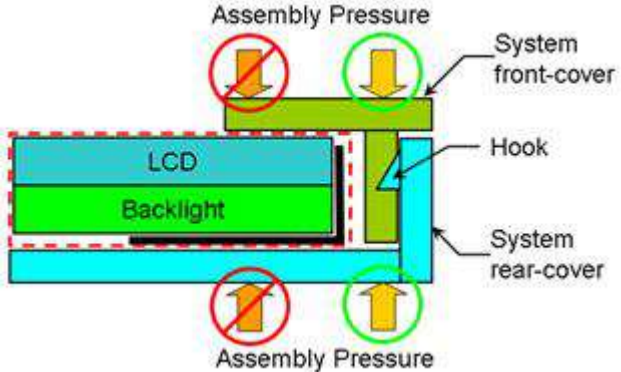

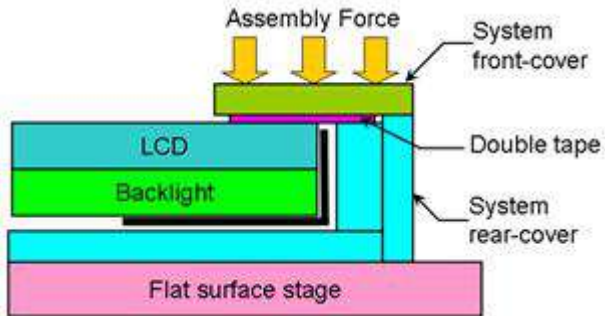

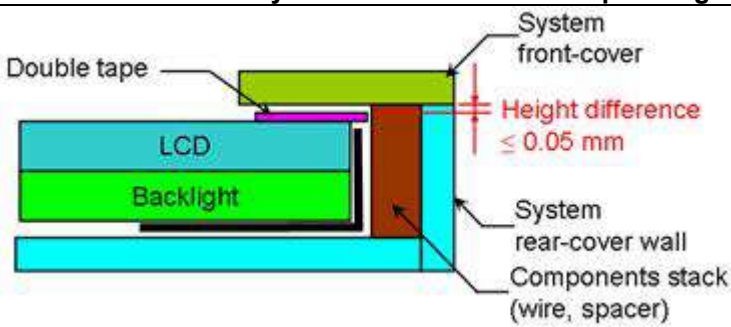

### 6 Tape/sponge design on system inner surface

## PRODUCT SPECIFICATION

 <p>Panel rear-cover System rear-cover Tape/Sponge LCD Backlight</p>	
Definition	To prevent abnormal display & white spot after scuffing test, hinge test, pogo test, backpack test, tape/sponge should be well covered under panel rear-cover. Because tape/sponge in separate location may act as pressure concentration location.
7	<b>Material used for system rear-cover</b>
 <p>System rear-cover material: Al-Mg alloy System rear-cover thickness: 1.5mm MIN</p>	
Definition	System rear-cover material with high rigidity is needed to resist deformation during scuffing test, hinge test, pogo test, or backpack test. Abnormal display, white spot, pooling issue may occur if low rigidity material is used. Solid structure design of system rear-cover may also influence the rigidity of system rear-cover. The deformation of system rear-cover should not caused interference.
8	<b>System base unit design near keyboard and mouse pad</b>
 <p>System rear-cover System front-cover System base unit Keyboard/Mouse pad Sharp edge</p>	
Definition	To prevent abnormal display & white spot after scuffing test, hinge test, pogo test, backpack test, sharp edge design in keyboard surface may damage panel during the test. We suggest to use slope edge design, or to reduce the thickness difference of keyboard/mouse pad from the nearby surface.
9	<b>Assembly SOP examination for system front-cover with Hook design</b>

# PRODUCT SPECIFICATION

	
Definition	To prevent panel crack during system front-cover assembly process with hook design, it is not recommended to press panel or any location that related directly to the panel.
10	<b>Assembly SOP examination for system front-cover with Double tape design</b>
	
Definition	To prevent panel crack during system front-cover assembly process with double tape design, it is only allowed to give slight pressure (MAX 3 Kgf/50mm <sup>2</sup> ) with large contact area. This can help to distribute the stress and prevent stress concentration. We also suggest putting the system on a flat surface stage to prevent unequal stress distribution during the assembly.
11	<b>System front-cover assembly reference with Double tape design</b>
	
Definition	To prevent system front-cover peeling at double tape contact area, Height difference between system front-cover assembly reference such as wall or components stack (wire, spacer) and double tape top surface must be less than 0.05mm.
12	<b>Touch Application : TP and LCD Module Combination for White Line Prevention</b>

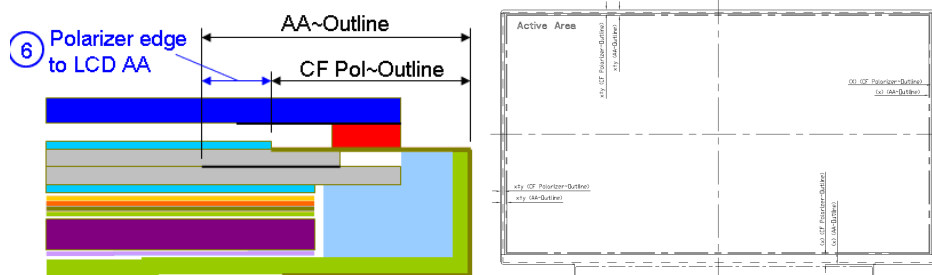

## PRODUCT SPECIFICATION

### Parameter consideration for White Line Issue :

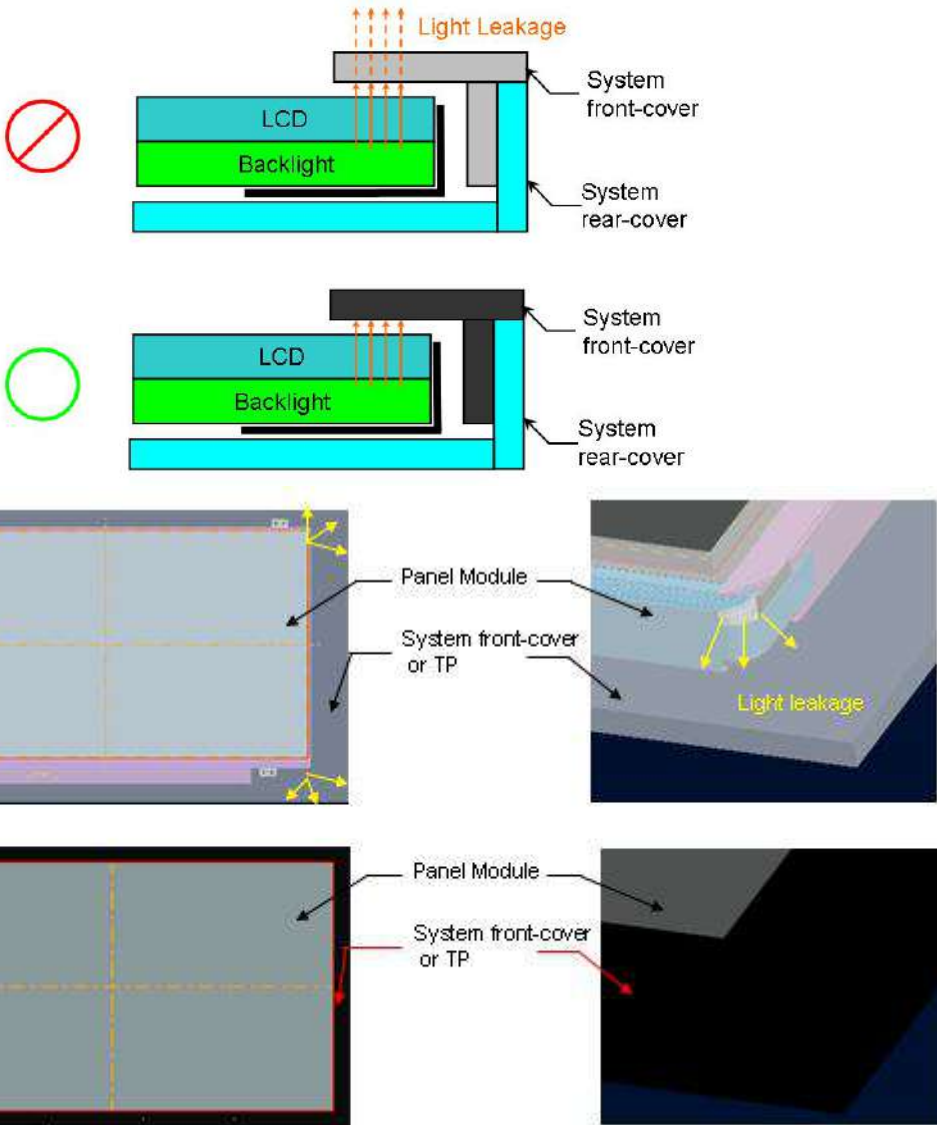

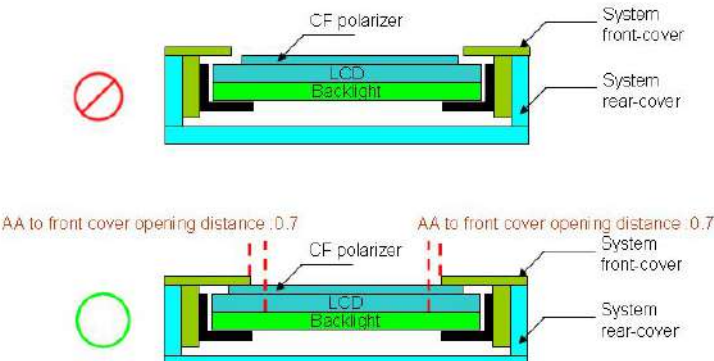

1	TP VA to LCD AA distance
2	TP Assembly tolerance
3	TP Ink Printing tolerance
4	Sponge thickness and tolerance
5	Inspection/Viewing Angle specification
6	Polarizer edge to LCD AA distance and tolerance

Polarizer edge to LCD AA distance can be derived by "AA~Outline" – "CF Pol~Outline" with respect to INX 2D Outline Drawing on each side.

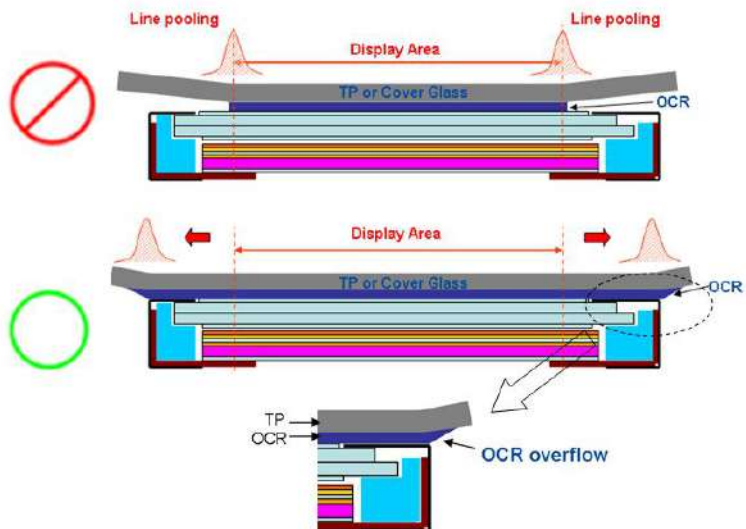

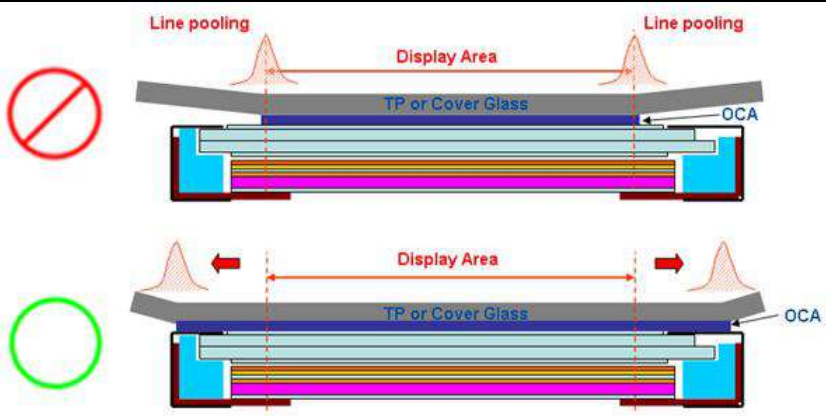

Definition	<p>For using in Touch Application: to prevent White Line appears between TP and LCD module combination, the maximum inspection angle location must not fall onto LCD polarizer edge, otherwise light line near edge of polarizer will be appear.</p> <p>Parameters such as TP VA to LCD AA distance, TP assembly tolerance, TP Ink printing tolerance, Sponge thickness and tolerance, and Maximum Inspection/Viewing Angle, must be considered with respect to LCD module's Polarizer edge location and tolerance. This consideration must be taken at all four edges separately.</p> <p>The goal is to find parameters combination that allow maximum inspection angle falls inside polarizer black margin area.</p> <p>Note: Information for Polarizer edge location and its tolerance can be derived from INX 2D Outline Drawing ("AA ~Outline" - "CF Pol~Outline").</p> <p>Note: Please feel free to contact INX FAE Engineer. By providing value of parameters above on each side, we can help to verify and pass the white line risk assessment for customer reference.</p>

13	Color of system front-cover material
	 <p>The diagrams illustrate the importance of using dark-colored material for the system front-cover to prevent light leakage. The top section shows a cross-section of the LCD and Backlight assembly. A red 'X' indicates that a transparent front cover allows light to leak out, while a green circle indicates that a dark front cover prevents this. The middle section shows a top-down view of the Panel Module. A red 'X' indicates light leakage at the edges of the front cover, while a green circle indicates no leakage. The right side shows close-up 3D views of the edge seal, highlighting the 'Light leakage' (yellow arrows) and the 'Light leakage' prevention (dark material).</p>
Definition	To prevent light leakage is seen at system front-cover due to material transparency, we suggest using dark color material (black) for system front-cover design.
14	AA to front cover opening distance
	 <p>The diagrams illustrate the importance of maintaining a specific distance between the active area (AA) and the front cover opening. The top section shows a cross-section of the LCD and Backlight assembly. A red 'X' indicates that a transparent front cover allows light to leak out, while a green circle indicates that a dark front cover prevents this. The bottom section shows a cross-section of the LCD and Backlight assembly with the CF polarizer. A red 'X' indicates light leakage through a transparent front cover, while a green circle indicates no leakage with a dark front cover. The distance between the AA and the front cover opening is specified as 0.7mm.</p>
Definition	To prevent CF polarizer edge leakage .We suggest front cover opening no more than 0.7mm larger than active area on all 4 sides.
