A. General Description

A070VW04 is an amorphous transmissive type TFT (Thin Film Transistor) LCD (Liquid crystal Display). This model is composed of TFT-LCD, drive IC, FPC (flexible printed circuit), and backlight unit. The timing controller is embedded, so it is easily to design for consumer product.

B. Features

- 7-inch display size
- WVGA resolution and stripe dot arrangement
- Built in timing controller
- LED backlight
- Standby mode supported
- Up/Down, Left/Right reversion selection
- SYNC + DE Mode
- Parallel 18/24bits interface support
- 16 M color supported
- Wide viewing angle
- RoHS compliant green design

C. General Information

NO.	Item	Unit	Specification	Remark
1	Display Resolution	dot	800RGB(H)×480(V)	
2	Active Area	mm	152.40(H)×91.44(V)	
3	Screen Size	inch	7.0(Diagonal)	
4	Pixel Pitch	mm	0.1905(H)×0.1905(V)	
5	Color Configuration		R. G. B. Stripe	Note 1
6	Color Depth		16.7M Colors	Note 2
7	Overall Dimension	mm	164(H) × 103(V) × 5.1(T)	Note 3
8	Weight	g	153.5 +/- 10%	
9	Panel surface treatment		Anti-Glare	
10	Display Mode		Normally White	

Note 1: Below figure shows dot stripe arrangement.

Note 2: The full color display depends on 24-bit data signal (pin 4~27).

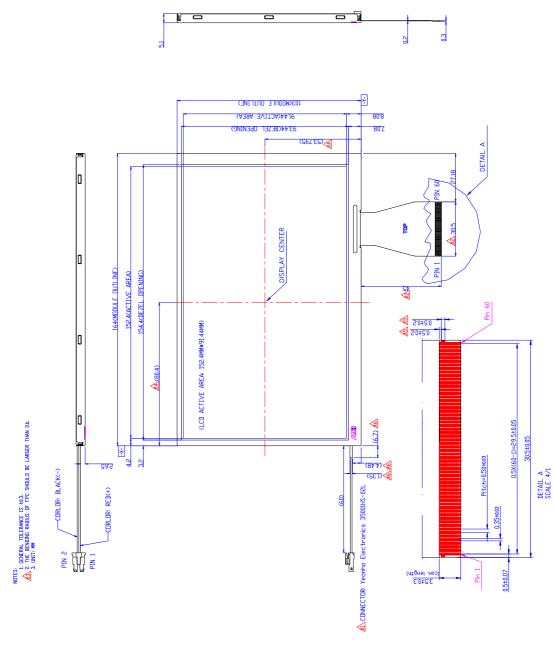

Note 3: Not include blacklight cable and FPC. Refer next page to get further information.

2. Backlight Driving Conditions

Parameter	Symbol	Min.	Тур.	Max.	Unit	Remark
LED lightbar Current	Ι _L	120	140	160	mA	
LED light bar Voltage	V_L			12	V	
LED Life Time	LL	10,000			Hr	Note 2, 3

Note 1: The LED driving condition is defined for LED module (21 LED).

Page: 11/27

Note 2: Define "LED Lifetime": brightness is decreased to 50% of the initial value. LED Lifetime is restricted under normal condition, ambient temperature = 25° C and LED lightbar voltage = 12V.

Note 3: If it uses larger LED lightbar voltage more than 12V, it maybe decreases the LED lifetime.

6. Register Information

There is a total of 6 registers each containing several parameters. For a detailed description of the parameters refer to register table. The serial register has read/write function. D[15:12] are the register address, D[11] defines the read or write mode and D[10:0] are the data.

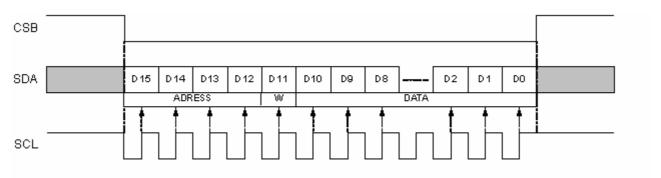

Figure 7: Serial interface write sequence

- 1. At power-on, the default values specified for each parameter are taken.
- 2. If less than 16-bit data are read during the CS low time period, the data is cancelled.
 - The write operation is cancelled.
- 3. All items are set at the falling edge of the vertical sync, except R0[1:0].
- 4. When GRB is activated through the serial interface, all registers are cleared, except the GRB value.
- 5. The register setting values are valid when VCC already goes to high and after VSYNC starts.
- 6. It is suggested that VSYNC, HSYNC, DCLK always exists in the same time. But if HSYNC, DCLK stops, only VSYNC operating, the register setting is still valid.
- 7. If the chip goes to standby mode, the register value will still keep. MCU can wake up the chip only by changing standby mode value from low to high.
- 8. The register setting values are rewritten by the influence of static electricity, a noise, etc. to unsuitable value, incorrect operating may occur. It is suggested that the SPI interface will setup as frequently as possible.

Note 1:Ambient temperature =25 $^{\circ}$ C , and LED lightbar voltage V_L = 12 V. To be measured in the dark room.

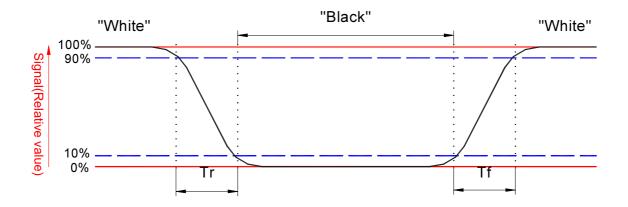

Note 2:To be measured on the center area of panel with a viewing cone of 1° by Topcon luminance meter BM-7, after 15 minutes operation.

Note 3. Definition of response time:

The output signals of photo detector are measured when the input signals are changed from "black" to "white" (falling time) and from "white" to "black" (rising time), respectively.

The response time is defined as the time interval between the 10% and 90% of amplitudes. Refer to figure as below.

Note 4. Definition of contrast ratio:

ALL RIGHTS STRICTLY RESERVED. ANY PORTION OF THIS PAPER SHALL NOT BE REPRODUCED, COPIED, OR TRANSFORMED TO ANY OTHER FORMS WITHOUT PERMISSION FROM AU OPTRONICS CORP.

Page: 24/27

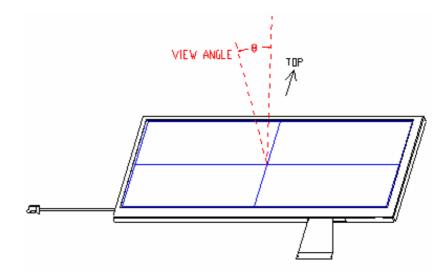

Contrast ratio is calculated with the following formula.

Contrast ratio (CR)=

Photo detector output when LCD is at "White" state

Photo detector output when LCD is at "Black" state

Note 5. Definition of viewing angle, θ , Refer to figure as below.

Note 6. Measured at the center area of the panel when all the input terminals of LCD panel are electrically opened.
