Note 1. Ambient temperature = 25° C.

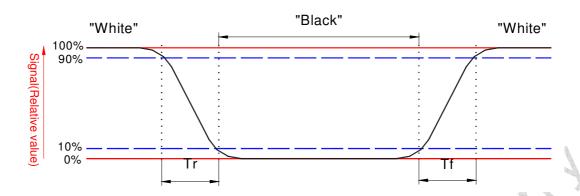

Note 3.To be measured on the center area of panel with a field angle of 1°by Topcon luminance meter BM-5A, after 10 minutes operation.

Note 4. Definition of response time:

The output signals of photo detector are measured when the input signals are changed from "black" to "white" (falling time) and from "white" to "black" (rising time), respectively.

The response time is defined as the time interval between the 10% and 90% of amplitudes. Refer to figure as below.

Note 2. To be measured in the dark room.

Note 5. Definition of contrast ratio:

Contrast ratio is calculated with the following formula.

Contrast ratio (CR)= Photo detector output when LCD is at "White" state

Photo detector output when LCD is at "Black" state

Note 6. White $Vi=V_{i50} + 1.5V$

Black $Vi=V_{i50} \pm 2.0V$

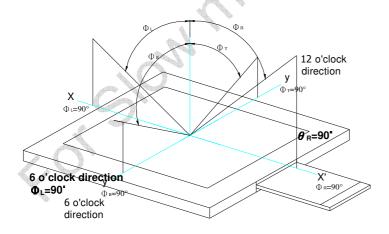

"±" Means that the analog input signal swings in phase with COM signal.

" $\overline{+}$ " Means that the analog input signal swings out of phase with COM signal.

V_{i50}: The analog input voltage when transmission is 50%

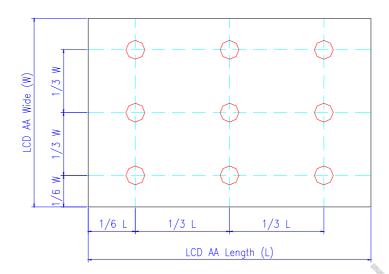

The 100% transmission is defined as the transmission of LCD panel when all the input terminals of module are electrically opened.

Note 7. Definition of viewing angle, $\ \phi$, Refer to figure as below.

Note 8. Measured at the center area of the panel in gray level 255

Note 9. Luminance Uniformity of these 9 points is defined as below:

Uniformity = $\frac{\text{minimum luminance in 9 points (1-9)}}{\text{maximum luminance in 9 points (1-9)}}$
